

PETRONAS

Driving Sustainability with Energy Digital Twin

Technical Presentation

Fadzrul Ali, Azleen Hing, Noorhidayah Hussein, Zalina Harun
PETRONAS, Kuala Lumpur, Malaysia

Schlumberger Digital Forum 2022

21st September 2022

PETRONAS Group adopts zero tolerance against all forms of bribery and corruption. As an employee, it is incumbent upon each and everyone of us to internalise and abide by the PETRONAS Code of Conduct and Business Ethics (CoBE) & Anti-Bribery and Corruption (ABC) Manual while remain guided by our shared values of loyalty, integrity, professionalism and cohesiveness.

Our story

- **PETRONAS** is a **Progressive Energy and Solutions Partner** with presence in over 50 countries.
- PETRONAS operations covers Upstream, Downstream, Gas Business and Clean Energy Solutions.
- Our team is part of the Process Department of Group Technical Solutions, Project Delivery & Technology (PD&T)
- As PETRONAS' **Centre of Excellence**, PD&T unites expertise in project, technical, digital and technology, to deliver sustainable energy and progressive value for the entire Group.

Steam is the number ONE choice for heating medium in the process industry

Steam generation:

- Standalone
- Centralised

Challenges:

- High fuel gas costs
- CO2 emissions

Digital driven system to improve efficiency & sustainability

Lifecycle application of first-principle model in energy audit and performance monitoring increases overall value

Manual spreadsheeting for steam balance reporting

Regular automated reporting plus:

- Engineering analysis
- Optimization
- Troubleshooting
- OTS

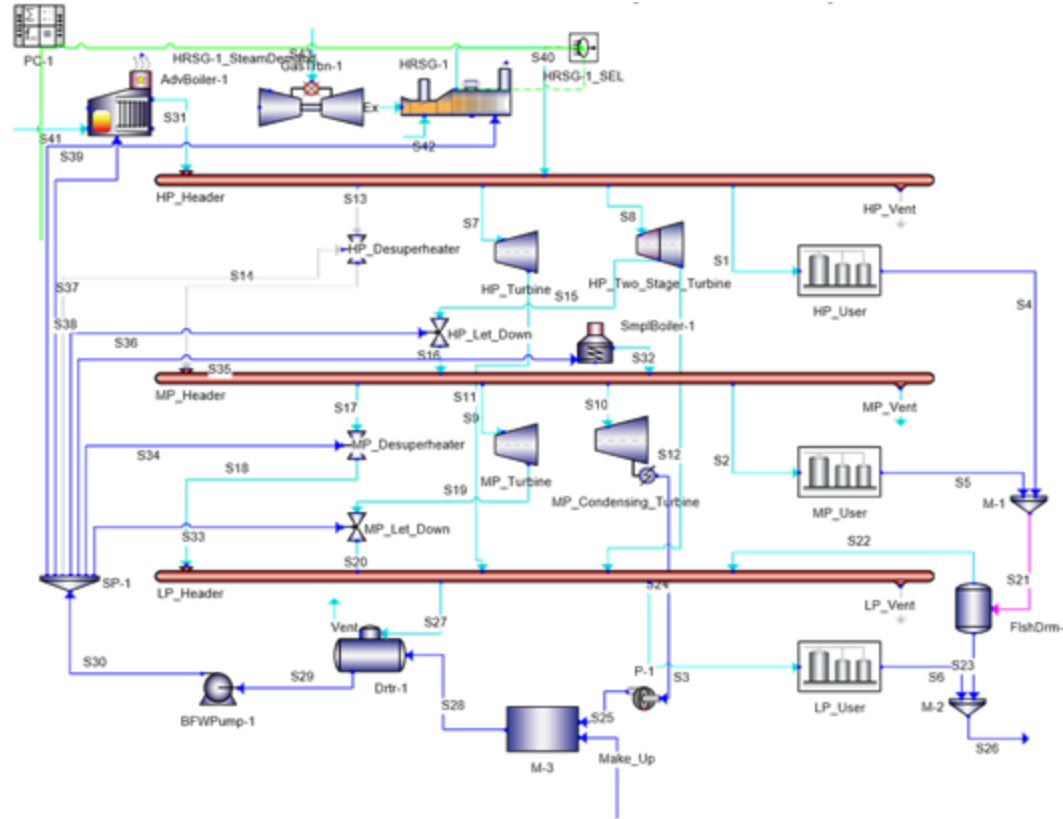

It is an accepted best practice to perform a structured energy audit to identify value leakages and improvement opportunities.

PETRONAS uses the Symmetry iCON® iUO, a custom energy modelling feature within Symmetry iCON® platform to construct a first principle model that runs an energy digital twin for a utility system

Symmetry iCON® Development Project between PETRONAS and SLB

The Energy Digital Twin architecture can be configured into a descriptive and predictive functionality to enhance the operation experience

An O&G terminal uses gas turbines to generate power and heat to bring up hot oil to the specified temperature

- Power and heat combined cycle using gas turbine generators.
- Gas turbine exhaust sent to a waste heat recovery unit to re-heat returning heat transfer oil.
- Decision to analyse the optimum number of turbines to run with WHRU to reduce fuel gas consumption and greenhouse gas emissions.

Optimising the number of gas turbines in operations resulted in cost savings and reduced equipment carbon footprint

Fuel gas optimisation study conducted in the facility recommended to operate with two GTs running instead of three.

Case Study	Fuel Gas Consumption (%)
Running two (2) instead of three (3) gas turbines	- 20%

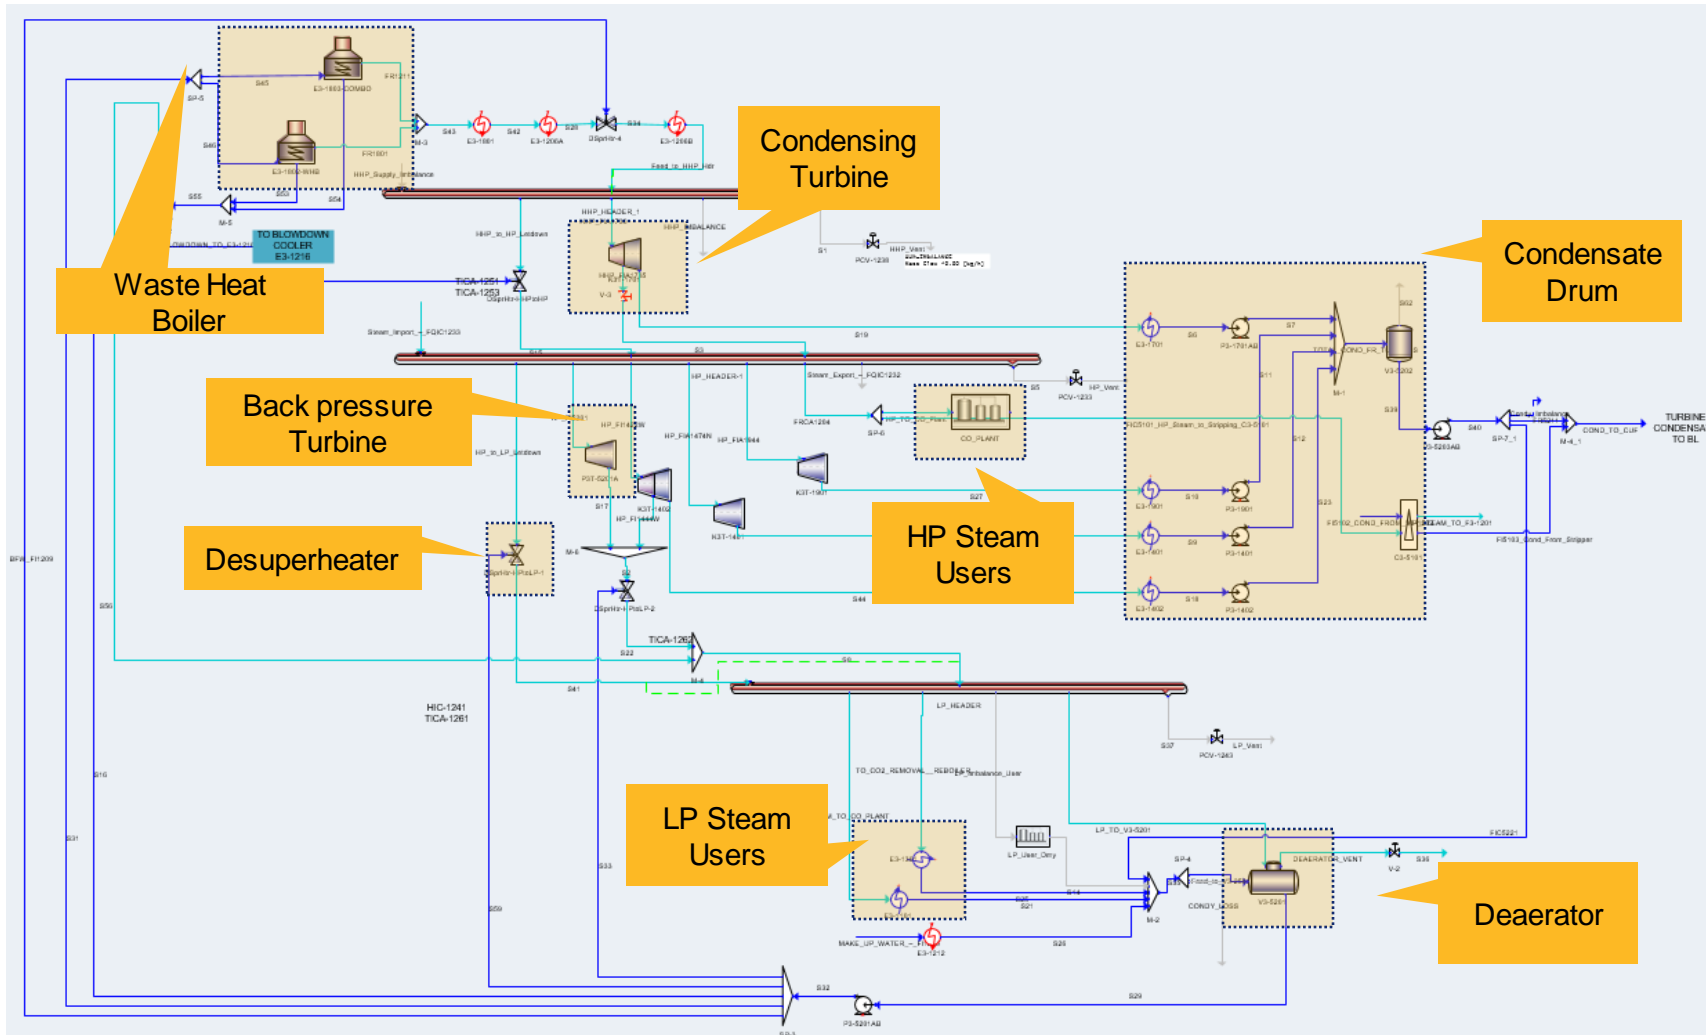

Potential of cost savings of:
More than USD 1 Million per year

From Carbon Footprint Assessment, this may contribute to the reduction in CO₂ emissions:
~ 400 tonnes of CO₂e per year

An online energy digital twin developed using Symmetry iCON® iUO

Model Description:

- 3 Steam Header Level (HHP, HP, and LP)

Input to Model:

- Steam Header Pressure
- Steam user's flowrate
- Steam turbine discharge conditions (P&T)

Output from Model

- Steam Header temperature
- Overall steam balance
- Steam turbine duty and efficiency
- LP steam flowrate to deaerator

A sample dashboard showing the comparison between plant data simulation model results and trending

Steam Reforming Plant Load: 0.00 to 103.53

Back End Load(%)|BE PL: 0.00 to 108.67

Equipment performance such as efficiency and duty can be monitored near real-time

Date Selection

Plant Load Selection

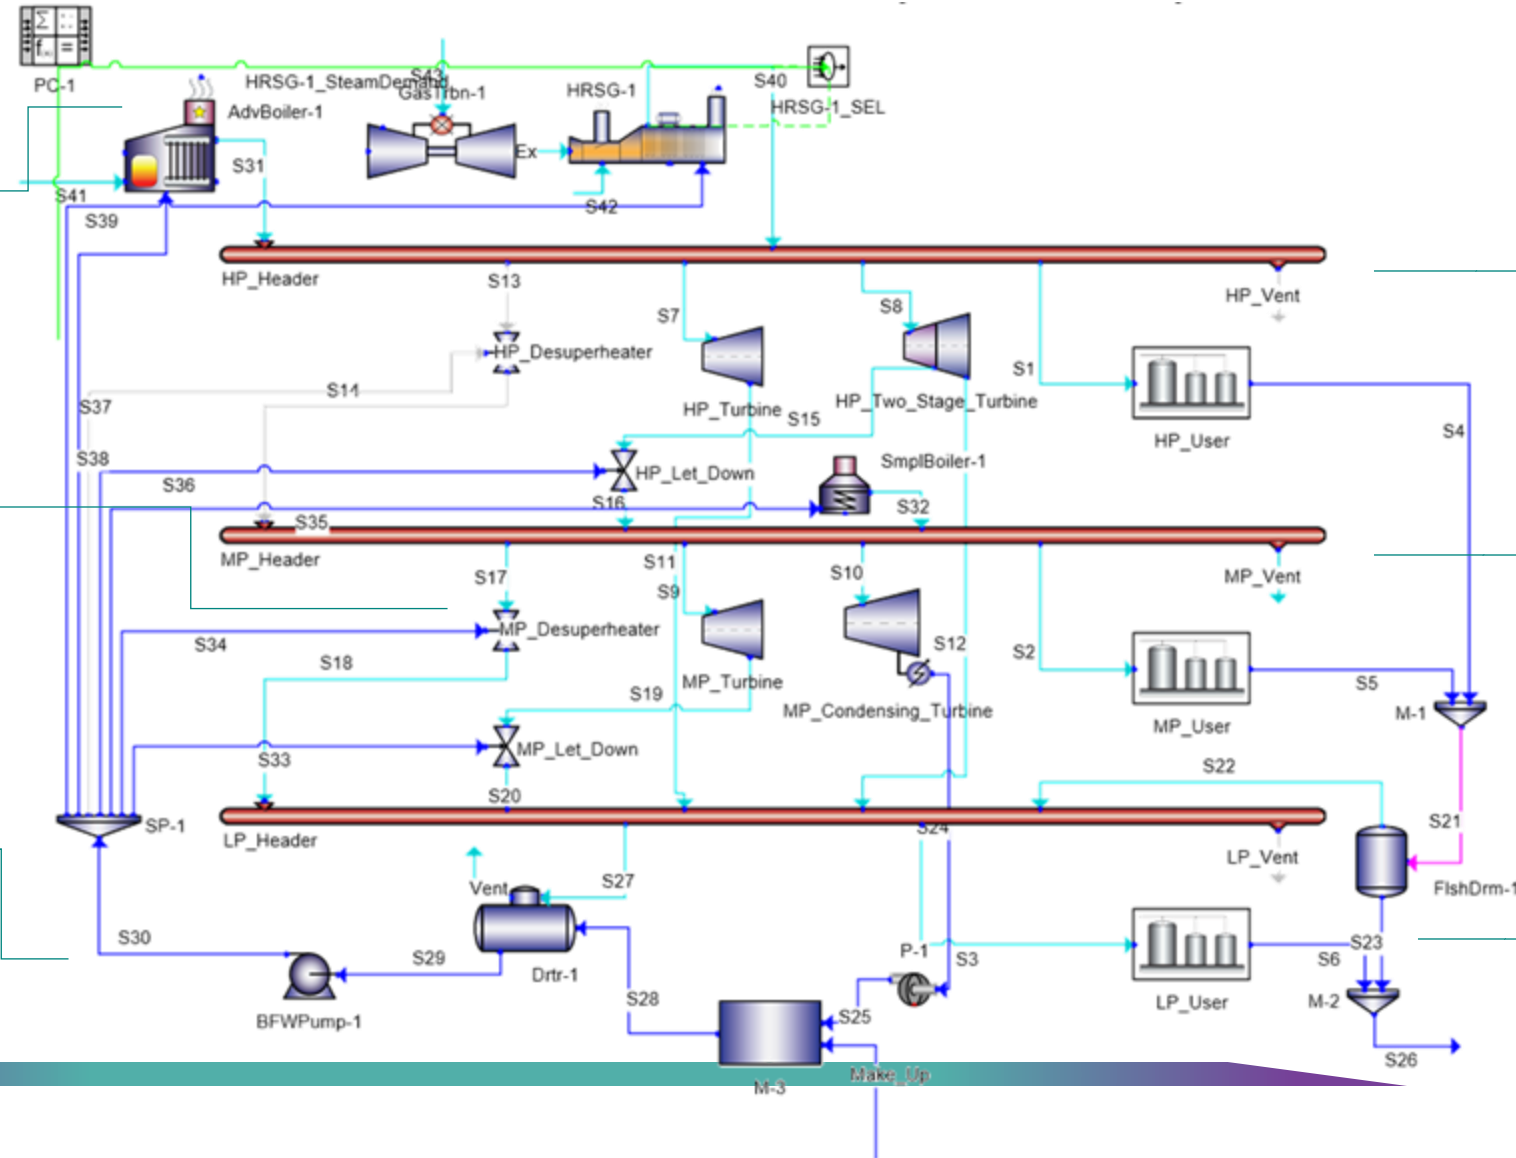

- Deviation between modelled and plant data could be detected via near real time monitoring.
- The discrepancies could trigger discussion among the technologist and operations to investigate the potential issues identified.

An online model acts as the foundation for an online open loop optimisation

Reduce excess air to optimize Stack O2

Install new STG to reduce steam letdown

Optimize BFW pump outlet & deaerator pressure

Optimize header pressure

Reduce MP header venting

Return condensate to reduce water import

Conclusions

- An **Energy Digital Twin** is a main enabler in moving towards digital transformation of the energy and utilities sector.
- Continuous monitoring of Key Performance Indicators (KPIs), **efficiencies and losses** enables **timely corrective and maintenance actions** by plant engineers and operators.

Recommendations on potential new features or digital solutions

Potential new features to Symmetry or other SLB digital solutions include:

- Automated data retrieval and reconciliation
- Solutions for faster convergence and robust optimization e.g. Equation Oriented (EO) Solver, data driven models

Implementation of these recommendations will improve agility, responsiveness, and efficiency to fully leverage on the **complete digital twin experience**.

Thank You
