Agenda

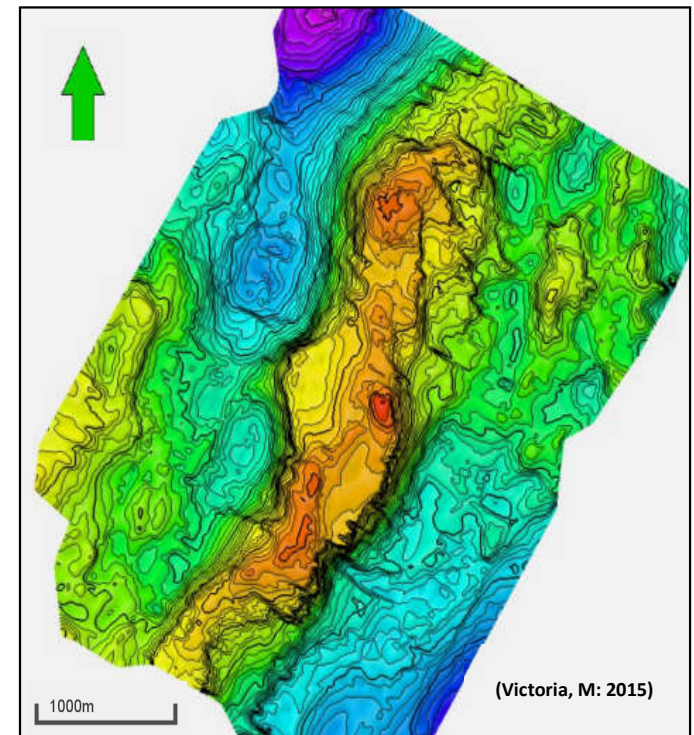

- Introduction
 - ✓ Background
 - ✓ Challenges
 - ✓ Proposed solutions
- Reservoir characterization
 - ✓ Faults
 - ✓ Horizons
- Fault framework and Volume Based Modeling (VBM)
- Stair-Step Gridding
- Results & Conclusions

Background

- Two oil wells producing from a fractured carbonate reservoir
- 5 km NE-SW elongated structure with rotated blocks limited by two lateral faults
- Two reservoir rocks over-imposed; sucrosic dolomites and karstified limestones
- Complex stratigraphic relationships with carbonates patches and onlaps/downlaps
- Complex fault geometries and truncations

RESERVOIR
CHARACTERIZATION

FAULT FRAMEWORK
AND VBM

STRUCTURAL GRIDDING

RESULTS AND
CONCLUSIONS

Challenges

- Represent the complex carbonate's geology in a 3D model capturing the reservoir behavior and connectivity.
- Several issues faced using Traditional Pillar gridding :
 - 1) Too complex fault modeling process; not all the faults included in the 3D grid
 - 2) Structural and stratigraphic complexity was not honored
 - 3) Resulting 3D grid with a large number of distorted cells; slow simulation and convergence problems

Proposed solutions

- Use the Structural Framework (SF), Volume Based Model (VBM) algorithm, and Stair-step gridding to :
 - ✓ Reduce the time spent on building the structural grids
 - ✓ Solve the stratigraphic and structural complexities
 - ✓ Assure to build the optimum grid to run dynamic simulations

Fault framework and VBM

Structural Modeling – Fault Framework

- Fault framework process simplifies the fault modeling
- All fault geometries and truncations easily handled
- Drastic reduction of time spent in fault modeling and editing

Fault Framework and VBM

Structural Modeling – Boundary Definition

“Watertight model”: the creation of a model with closed boundaries was key to avoid the extrapolation of the horizons out of the faults limits.

Fault Framework and VBM

Structural Modeling – Horizon Modeling

Need of combining different horizons and changing stratigraphic relationships to capture complexity

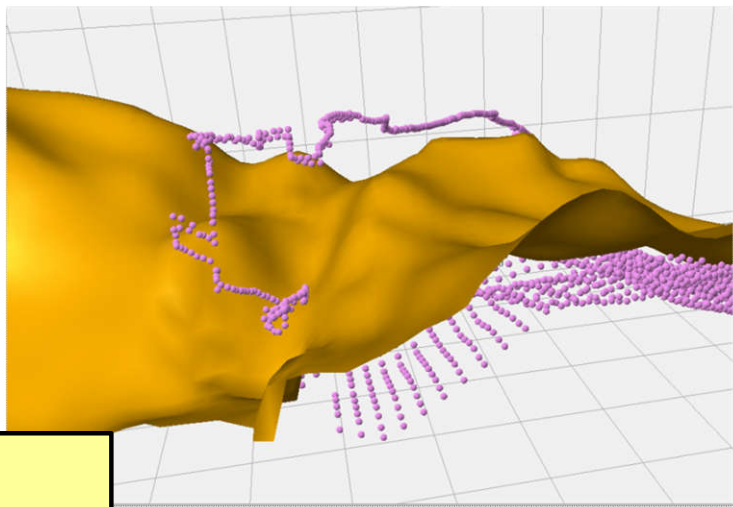

Petrel 2016 – Base-Base horizon relationship available. No need of combining horizons anymore

Stair-Step Gridding

Solution: Control points to constrain the horizon modeling

FRAMEWORK AND VBM

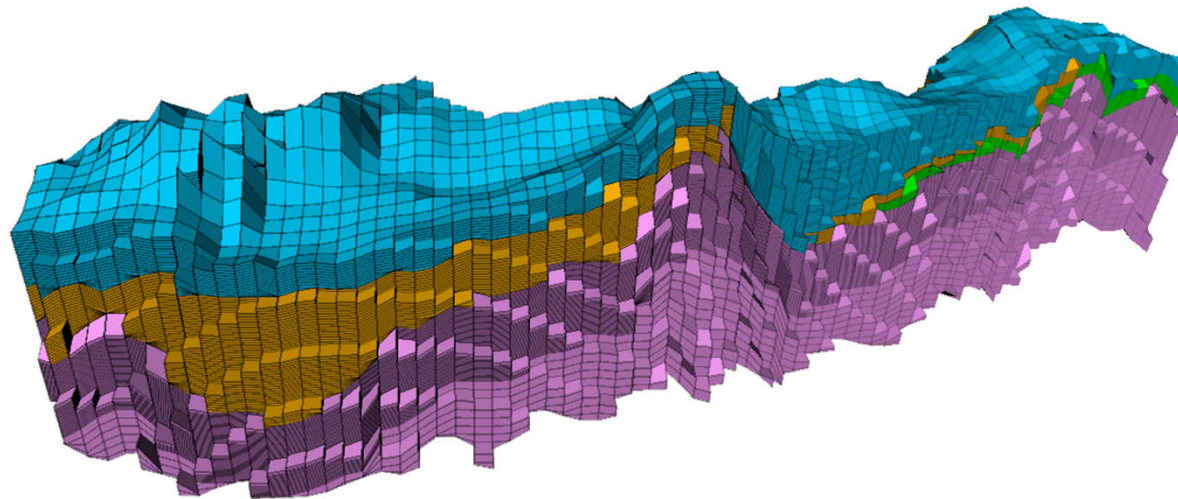

STAIR-STEP GRID

RESULTS AND
CONCLUSIONS

Structural gridding

- **Structural gridding** process generates **Stair-step grids** which avoid the shortcomings and limitations of the Pillar grids related to complex structural relationships and cells distortion.
- Stair-step grids are more suitable for simulation than traditional Pillar grids. Usually, less time is needed for review and QC

STRUCTURAL GRIDDING

RESULTS AND
CONCLUSIONS

Results

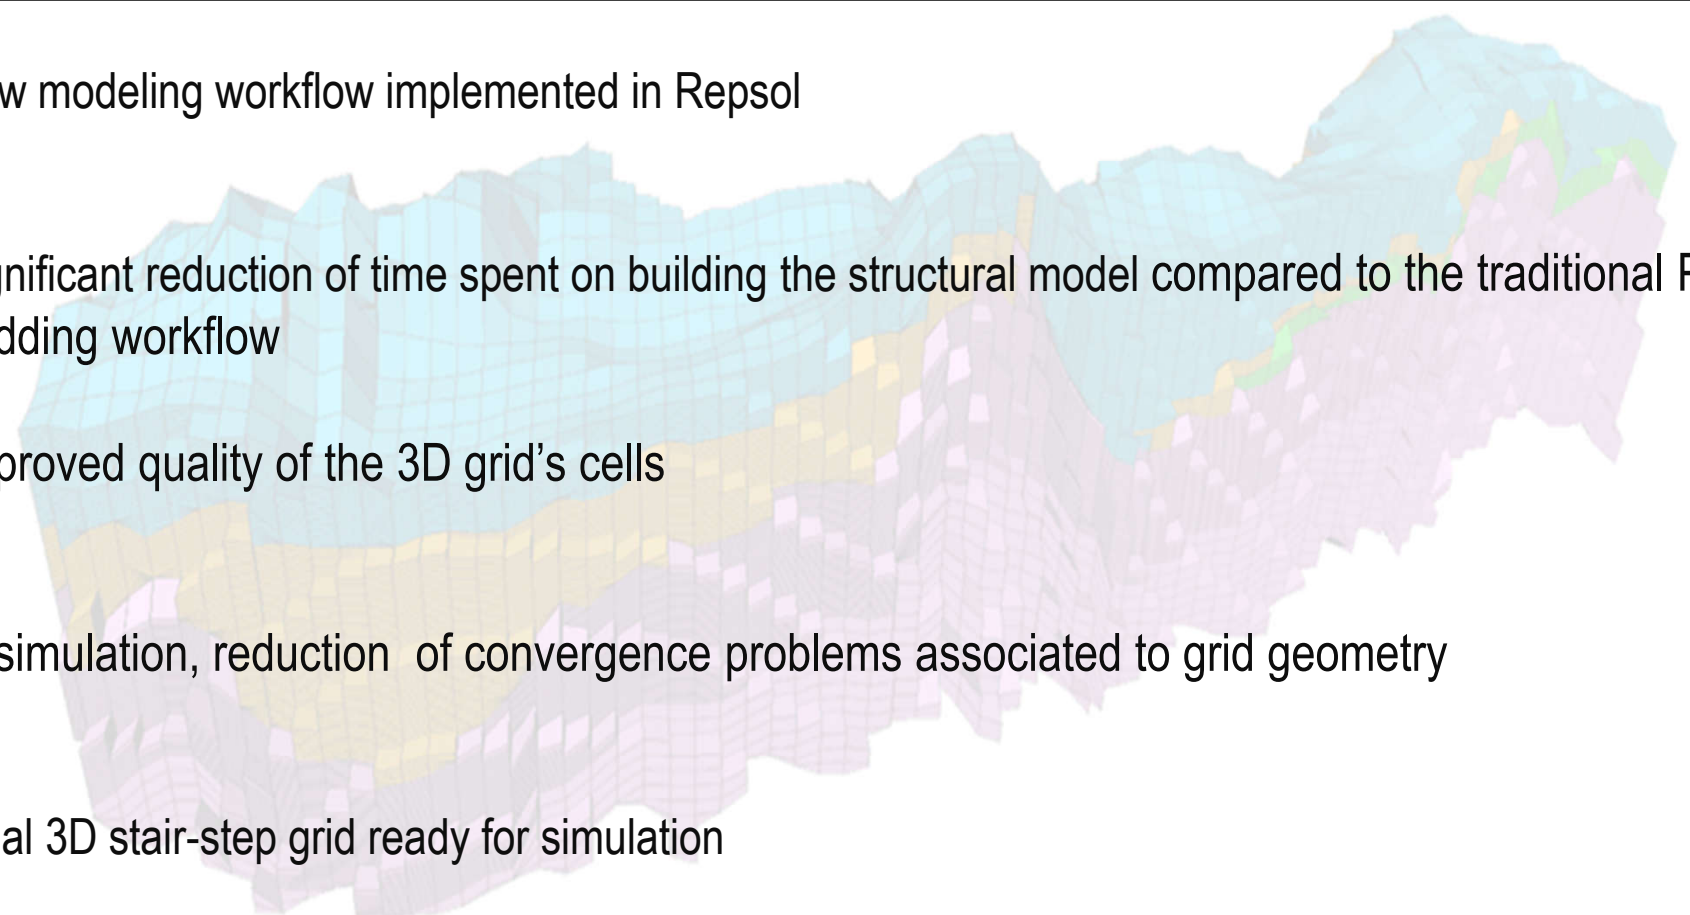

- I. All the faults were included in the final Structural grid. It was not possible in the Pillar grid
- II. Maximum **cells angle** drastically reduced
- III. **No cells inside out** and **no cells with negative volume**
- IV. **Volumetrics** showing similar values than the Pillar grid model, with a difference of less than 1%

Cell angle	% of cells (Stair-Step grid)	% of cells (Corner point grid)
<15°	95	37
<25°	99	66
Max. Angle	44°	77°

Conclusions

- ✓ New modeling workflow implemented in Repsol
 - ✓ Significant reduction of time spent on building the structural model compared to the traditional Pillar gridding workflow
 - ✓ Improved quality of the 3D grid's cells
 - ✓ In simulation, reduction of convergence problems associated to grid geometry
 - ✓ Final 3D stair-step grid ready for simulation
- 
- A 3D visualization of a structural model, likely representing a reservoir or geological formation. The model is composed of numerous small, interconnected cells, forming a complex, multi-layered structure. The cells are colored in shades of blue, yellow, and purple, indicating different geological layers or properties. The overall shape is irregular and follows a topographic-like profile.
